affected by N or K application. However, K reduced percent fiber cane, which is a positive response. Cane yields were also improved by application of N and K . The best result in tonnes cane/ha was obtained with $60 \mathrm{~kg} \mathrm{~N} / \mathrm{ha}$ and $90 \mathrm{~kg} \mathrm{~K}_{2} \mathrm{O} / \mathrm{ha}$ applied at planting time. This fact is very important because in terms of maximum eco-
nomic yields in commercial fields, it is possible to eliminate the need for sidedressed NK fertilization. BC

## PPI (INPOFOS) Ecuador Office Moves to New Location in Quito

The office of the Northern Latin America Program of PPI has a new location. Also known as INPOFOS (Instituto de la Potasa y el Fosforo), the program is directed by Dr. José Espinosa.
"Changing needs dictated this move. We are optimistic that the improved facilities of the new office location will help us maintain and even improve our effectiveness and productivity in agronomic research and education programs of this
important region," said David W. Dibb, President of PPI.

The new address and phone numbers are:
